![Ps] **Adobe Photoshop**

Panorama Picture

Now that the iPhone 5 has an option for taking the panorama picture, you might wonder why this tutorial is necessary. Taking the panorama picture is a skill that can be expanded to include more than a single pass of the camera. Our pictures will be done with iPads or cameras we have in the classroom.

1. The most critical part of taking a panorama picture is making sure that you capture about 1/3 of the previous image in each photograph you take. Our panorama pictures will be made up of at least 7 individual shots. Here's how it's done.

2. In the photograph above, each colored square represents a different shot of the scene. Notice how they overlap one another. This is essential in order to have a successful panorama shot for Photoshop.

3. Once you have taken your pictures, transfer them over to one of the computers in the classroom. Save them in a folder inside your home directory (H: drive).

4. Open Adobe Photoshop. You do not need to create a new document.

5. From the File menu, select Automate / Photomerge.

6. Click the button labeled Browse and navigate to your photos. Select all of the photos for your project and click OK.

7. Once your pictures have loaded, click OK in the upper right corner of the dialog window.

8. When your photo has been merged, it will load in your Photoshop window. You can now use the Rectangular Marquee Tool, shown below, to draw a box around your image.

9. Crop your image to the selection by clicking Image / Crop.

10. Save your photo to your home folder (H: drive) with your name in the filename.

11. Copy the document to our class dropbox.
